FG-P

The FG-P is a light tactical vehicle built on a Ford Ranger 1-ton Pickup designed for defense and security operations. Ford Global Fleet Sales offers customized applications and equipment to suit customers' needs.

JP8 Capability

The JP8 fuel conversion allows the FG-P to run on all grades of diesel fuel and even jet fuel.

Blackout System

Black Out Function Switches off all light emitting sources with the flick of a switch.

3.5T GVW

The FGFS suspension upgrade ensures enhanced handling and long-term durability under heavy loads and extreme conditions.

RANGER SUPER DUTY

FGFS continues to offer a GVM upgrade - to 3,500 kg - on the standard Ranger and Everest. But we now have an exciting new addition to the portfolio. The all-new Ranger Super Duty has been developed by professionals for professionals, built for those who demand more from a mid-sized truck. With a 4,500 kg towing capacity, 4,500 kg GVM and an 8,000 kg Gross Combination Mass, the Super Duty is the toughest Ranger ever engineered by Ford.

Super Duty is a badge only awarded by Ford to their toughest vehicles. Ranger Super Duty is a heavy-duty truck for heavy duty jobs, designed for emergency services, construction providers, farming and military operations. Engineered for extreme worksites and off-road adventures, this mid-sized truck offers incredible 4x4 capability and rugged durability.

FGFS is Ford's authorized global fleet distributor for the Ranger Super Duty.

The Ranger Super Duty is available either as a Single Cab Chassis, for upfit by modifiers, or as a Double Cab Pick Up. Through FGFS, both variants are available in militarized versions, set up for JP8 (F-34) in compliance with NATO inter-operability standards, fitted with blackout systems or convoy lighting for example. A commercial off the shelf vehicle built for more.

Jet Fuel Compatibility

The JP8 fuel conversion allows the FG-P to run on all grades of diesel fuel and even jet fuel.

What happens when a standard Euro 4+ engine runs on high sulfur or non-diesel fuel?

- The catalytic converters can become cloaked with contaminants.
- Exhaust Gas Recirculation (EGR) coolers can develop acid build up, leading to corrosion.
- Water could enter the engine and, in the worst case, result in a capital engine failure.
- The Engine Control Unit (ECU) will recognize EGR cooler corrosion and build-up, causing error codes that advise diagnosing the error at a minimum and often other problems.
- Injector and high-pressure pump degradation.
- Fuel pressure deviation resulting in a 'limp home' (reduced performance) condition.

Engine Calibration

Fuel Filtration

Engine Hardware
EGR system, high pressure pump liner, seals and hoses

Emission Control
back pressure valves, removal of DOC, DPF and SCR

What does the conversion consist of?

The catalytic converter is replaced with a non-catalytic muffler system. The EGR valve is blocked with a plate to prevent return exhaust from entering the EGR cooler. The cooler itself remains in place.

A hot climate option is an extra HD fuel cooler to operate F63, JP8, or similar low-viscosity fuels.

Software updates include recalibrating the engine control unit (ECU) to deactivate the EGR sensor and delete error codes that appear due to EGR blockage with the plate.

Recalibration of the ECU allows the unit to manage operations. At the same time, the vehicle can run on various fuels that do not meet the properties of Diesel, e.g., F63, JP8.

The updated calibration is loaded into the Ford after sales systems, ensuring it is included in regular service updates conducted via the Ford network.

Ford Global Fleet Sales has a long standing track record in JP8 fuel conversion. To date, over 50,000 vehicles have been converted and distributed to customers around the world. All conversions are durability tested on a specialized test cycle to represent 60,000km of use on pure high sulfur fuel.

Blackout System

At the flick of a switch, all vehicle lights and sound sources are turned off. This system is designed for stationary observation or active surveillance.

How does it work?

When the operator turns on "Black Out," a series of control modules activate and instruct all smart modules to turn off their light sources or enter sleep mode. All passive systems are also switched off to prevent any light illumination.

Sound emitting sources such as the horn and warning beepers are also switched off.

Convoy lights and infrared lights can be installed for military customers.

The primary vehicle functionality remains. The HVAC system operates normally, as do the engine and transmission. Power steering and all vehicle safety systems, such as ABS/ESP/Air-bag, remain activated and function normally.

Exterior Blackout Features

Vehicle Silent Mode

On many missions, it is critical to avoid being noticed. The silent mode gives the operator just that. With no combustion engine running, the vehicle has a minimum sound and heat signature to help avoid early detection.

How does it work?

The FG-P is equipped with an electric motor on the rear drive-line and a drive battery.

To activate it, the vehicle must be at a complete stop with the transmission in neutral. Then, the silent mode can be activated, and the engine shuts down. An interlock system prevents accidental engine operation.

The electric motor propels the vehicle at speeds up to 20km/h. Higher speeds are possible on request, and the range is scalable by various battery sizes and ranges from 2km to 30km.

In Silent Mode, the vehicle emits no engine sounds and eliminates all engine heat. This does not impact the engine's operation, and if needed, the engine can be quickly restarted.

Interior Blackout Features

4x4 conversion

Ford Global Fleet Sales 4x4 Van Conversions are built to conquer any terrain, whether it is on rutted rural roads or crumbling urban infrastructure.

Our powertrain system delivers exceptional performance and reliability in demanding environments. The rear axle system enhances traction and maneuverability without the need for electronic locking mechanisms, ensuring seamless operation in all conditions.

Our high-raised suspension system provides increased ground clearance and improved off-road capability, allowing vehicles to traverse rugged terrain with ease.

Upgrading to larger wheels enhances traction and stability, further improving the performance of your fleet in challenging environments.

Ford Global Fleet Sales mud deflectors protect vital components from debris and mud accumulation, ensuring optimal performance and reliability in all conditions.

FG-P

The new FG-P is built on the Next-Generation Ford Ranger Pickup. Tough, smart, and versatile, this Next-Generation Ranger is packed with new features and advanced technology.

Ford's global design DNA is reflected in the C-clamp Matrix LED headlamps and strong horizontal upper grille bar with a wider front end. Engines are available in Single-Turbo inline four-cylinder diesel engines and a 2.3L EcoBoost petrol engine. There is a new 3.0-liter turbo-diesel V6 with 184kW and 600 Nm of torque.

The cargo area includes a molded plastic bed liner, an integrated side-step, a wider bed, 360-degree zone lighting, a cargo management system, cargo tie-downs and more.

Depending on the model, a six-speed automatic or Ford's efficient 10-speed SelectShift automatic is available.

Ford Global Fleet Sales provides the most advanced ballistic protection solutions available up to Level 4 / BR6 protection. Made from steel or the lightest HPPE composite panels which offer the best weight to ballistic protection ratio.

FG-S

Military Field Ambulance

The FG-S is a truck-based SUV developed by FGFS and designed for field operations in the most challenging terrains.

The FG-S is fitted with Blackout and Silent Function, and a suspension upgrade to 3500kg. The diesel engine has been recalibrated to run on all fuel, including jet fuel (JP8).

Based on Ford's next-generation Everest, the FG-S is available in 4X2 and 4X4 with Hi and Low range and a 2.0L Single Turbo four-cylinder diesel engine.

The Ford Everest is a highly capable off-road vehicle with a wide track, high ground clearance, 800mm water wading, and is equipped with Ford's very latest engineering technology.

Water wading is 800mm (2.6ft), while the roof can hold static loads of 350kg (772 lbs) or dynamic loads as heavy as 100kg (220 lbs).

FG-V

The FG-V is a Transit 4X4 Conversion that transforms a rear wheel drive Ford Transit through a series of expertly engineered steps into a true off-roader with a 4-Hi and 4-Low drivetrain.

Externally, the Transit 4X4 looks formidable with its increased height and large off-road tires. The body has been raised by 100mm to accommodate the larger tires and extensive underbody modifications.

A new engine cradle, uprights, heavy-duty tower control arms, and a brand-new off-road suspension package deliver the most capable 4X4 in its class. Engineers have added a new front differential, prop shaft, and 4X4 transfer case. The rear is fitted with a new driveshaft and differential.

The front suspension is an independent MacPherson Struts layout, with upgraded coil springs and an upsized stabilizer bar. The rear suspension uses a new multi-leaf spring, providing maximum durability and load capacity.

360° Service and Support

Ford Global Fleet Sales Aftermarket Operations division ensures worldwide fleet operability with timely maintenance, parts supply and training. We offer responsive support through a global network, including a 24/7 technical hotline and fly-in technicians.

Our on-location teams set up fully functional workshops within 72 hours, equipped with essential tools. With a strategic inventory of vehicles and over \$16 million worth of parts, we ensure rapid assistance anywhere in the world.

RMA Paint can produce any variety of special or limited-edition colors. RMA Paint works with militaries to develop camouflage colors, defense colors schemes and infra-red reflective paints.

GLOBAL FLEET SALES

inquiries@globalfleetsales.net | fordglobalfleetsales.com

Dangerous duties require equipment you can count on. Ford Global Fleet Sales works closely with Ford and its dealers globally to provide critical vehicle deliveries and after-sales support that ensure fleets are up to whatever task is demanded of them and operate at maximum efficiency throughout their lifecycle.

FORD MILITARY HISTORY

Ford's roots as a trusted military supplier date back to U.S. involvement in WWII, when it began producing Jeeps for the U.S. military in 1941. The vehicles were nicknamed for their "GP," or general-purpose designation. By 1942, Ford halted all civilian auto production in the United States to produce military equipment. Through its manufacturing expertise, Ford facilities built numerous automobiles, planes, tanks, aircraft engines, and other materials for the war effort. By the end of WWII, Ford produced more than 8,000 B-24 Liberator bombers.

FORMATION OF FORD GLOBAL FLEET SALES

Fast forward to 2002, Ford Global Fleet Sales (FGFS) was formed out of a requirement to stand up to a fleet of Light Tactical Vehicles (LTVs) for the Afghan National Security Forces (ANSF) at the request of the U.S. Army's Tank and Automotive Command (TACOM). Initially, the ANSF ordered 265 vehicles from FGFS. However, over the next decade, FGFS's support for the ANSF grew significantly, with over 43,000 vehicles supplied, including customized modifications, logistical assistance, and ongoing fleet analysis. FGFS has also provided more than \$100 million in spare parts to support the fleet and has trained local nationals with critical skills to achieve long-term self-sufficiency.

Now the leading Ford distributor to militaries, police forces, and other organizations involved in security and counter-terrorism operations globally, FGFS has provided purpose-built Ford vehicles to nearly 100 countries worldwide.
